

Windows Vista

April 10, 2007

- Install the program when logged in as Administrator and tell it to install for “All Users”
- After the installation, right click the icon and left click Properties. Click the Advanced button at the bottom right and check mark “Run as administrator”.
- On the server, move Studio out of Program Files and onto the root or into another folder other than Program Files.
- Give full control to any users (everyone is the easiest) who will access the folder whenever possible.
- Within Advanced Security Settings click Edit on the user object and check mark “Replace all existing inheritable permissions on all descendants with inheritable permissions from this object” to insure that permissions are updated on all objects within the Studio folder.
- If data is hosted on a Vista computer, at least have Vista Business, and make the following registry change: Add a registry value named SMB2 under KEY_LOCAL_MACHINE/SYSTEM/CURRENTCONTROLSET/SERVICES/LANMANSERVER/PARAMETERS and set it to 0. Reboot the computer after making the registry change
